

Wednesday Nov 26, 2025 3-4pm

Agenda

- ☐ Who has experience with docker?
 - ☐ Create root user
 - ☐ Create a sample database and some tables in it
 - ☐ Make a image of postgres in the docker and store data in docker (NOTE : EVERYTHING SHOULD BE INSIDE DOCKER SUCH THAT WHEN MOVING TO CLOUD NO DEPENDENCIES SHOULD BE LEFT BEHIND, e.g. docker create a local docker storage for postgres so when you create a super user for postgres for the first time it stays in that docker forever so next time you have to use the same super user ,can't create a new super use like we can do on local machine)
 - ☐ Do it so well that if you are given with table schema and some dummy data you can create the entire database and know how to fetch/update the table
 - ☐ For best result : right from the start keep everything inside docker ,also be open to make change to location of the database itself because later we might want to put our database on AWS S3,
- ☐ Documentation, look at Andrew's 110 repo:
<https://github.com/cse110-sp23-group8/cse110-sp23-group8>
- ☐ Connecting everything
